## ED-Paint

The painting is an electrolytic dip coating used as the final cover as an anti-corrosion treatment. Examples of environments where this paint can be used are: food, mining, unheated rooms and laundries. It also offers excellent resistance to oil, gasoline and other solvents.

We always have a zinc phosphate under the ED-painting for maximum adhesion, and prevent creep corrosion in case of damage to the lacquer layer.

The paint is black as standard but provides a basis for powder coating, which means that you get a higher corrosion resistance and the ability to choose any colour you want for the final finish.

The maximum width for painting sections is 1500 mm.

The paint provides a covering of 20-25  $\mu$ m interior and exterior.

### Classification

Only Ed-paint - Matching C3 (Not outdoors)

Ed-paint + Powder coating - Matching C4 (Not outdoors)

### ED-paint

- Good for the environment
  - Corrosion protection
  - 20 -25  $\mu$ m
  - Certificated method-07
-
